

Alexey Grigorev

Agent demos skip the boring failures

The hard part starts when the worker restarts, a tool fails, or approval arrives later.

The demo works

The agent plans a step, calls a tool, gets a result, and continues. In a notebook or small app, that can look complete.

Then production happens

Workers restart. Deploys happen mid-run. Tool calls fail on step 6. A person approves the next action hours later.

Memory is not enough

If all state is in memory, there is not much to inspect or resume. The workflow needs durable state outside the agent process.

What should be stored

Run ID, current step, tool inputs, tool outputs, errors, retries, approval state, and enough history to continue safely.

Workshop focus

Nicholas Lotz will cover durable workflows for agents: persisting state, resuming after failures, retrying tools, approvals, traces, and deployment.
