Make agent tool use visible

A silent UI makes working agents feel broken.

Silence is confusing

If the user asks a question and nothing changes for 20 seconds, the app feels stuck even when the backend is doing useful work.

Stream the work

Show answer tokens as they arrive. Show tool calls, inputs, and results while the agent is still working.

Collapse noisy output

Tool results can be long. Keep them visible for debugging, but collapsed by default so the interface stays readable.

This is observability

Visible tool events show whether retrieval happened, which tool was called, and what data came back before the answer.
