

Alexey Grigorev

One Docker image can be enough

For a small agent app, keep deployment simple.

Small app, simple deploy

A FastAPI backend and a small JavaScript frontend do not always need separate services.

Use a multi-stage build

Build the frontend in a Node.js stage, then copy the generated static files into the backend image.

Keep runtime lean

The final container serves the API and frontend assets without carrying Node.js dependencies into production.

Still test inside Docker

The demo caught an API key issue only after running the app inside the container.
