

Alexey Grigorev

Run coding agents where work can continue

Long-running agent work should survive disconnects.

Local is fine first

For small experiments, your laptop is enough.
Do not add remote infrastructure before you
need it.

The failure mode

If a process is attached directly to SSH, it can die when the connection dies.

tmux helps

Run the coding-agent session inside tmux, disconnect, and attach again later when you are back.

Why it matters

Agent tasks can read a repo, edit files, run tests, inspect errors, and try again. That work can take time.
