Lambda for low-traffic agents

Small agent tools do not always need an always-on server.

The previous setup

The first deployment used a containerized web app. It worked, but the service still had to run somewhere.

Lambda changes the cost model

The function wakes up on invocation. If nobody uses the tool, there is no always-on server to pay for.

Still a full app

The Lambda Function URL served the frontend, handled the agent API, and streamed responses back to the browser.

Use it for the right workload

Lambda fits personal agents, internal tools, and occasional workflows. A steady public product may be simpler as a normal web service.
