

Alexey Grigorev

Give agents a sandboxed AWS account

Trust is easier when the blast radius is small.

Start with the risk

Before giving a coding agent AWS credentials, decide what it is allowed to break.

Keep production away

The remote machine did not have production AWS access. The experiment used a separate AWS account.

Scope the credentials

Use temporary credentials and project-local environment files instead of global shell variables when possible.

Better question

Do not ask whether you fully trust the agent. Ask what damage can happen if it makes a mistake.
