

Alexey Grigorev

Working first, then simplify

A practical workflow for coding agents.

Use a checkpoint

Let the agent get a version running, then commit that working state before changing more.

Do not stop there

Working code is not the finish line. Read the code and ask what each unfamiliar part is doing.

Agents overbuild

They can create wrappers, scripts, and abstractions that work but are harder to maintain than needed.

Simplify with intent

Keep the parts with a clear reason. Remove or rewrite the parts you cannot explain.
