

Alexey Grigorev

Lambda deployment gotchas

The code change is only part of the deployment.

More than Python

The deployment path includes a container image, ECR, CloudFormation, Function URL, environment variables, and local testing.

Use infrastructure as code

CloudFormation described the Lambda resources so they could be deployed repeatedly instead of assembled manually.

Small flags matter

One deployment issue came from Docker image metadata. Lambda rejected the image until provenance metadata was disabled.

Write the path down

Save the commands, failed attempts, required flags, and cleanup notes. The deployment document becomes part of the system.
