AWS access without keys

How a workshop problem became useful for coding agents too.

The workshop constraint

I needed 50 or 60 people to provision AWS resources from their own machines. No keys to copy. Nothing to install. No access to my main AWS account.

The credential endpoint

A Lambda assumes an AWS role and returns temporary credentials. The AWS SDK fetches them through

`AWS_CONTAINER_CREDENTIALS_FULL_URI`

.

Why this matters

Long-lived keys are hard to control once they leave your machine. Temporary credentials give you a way to scope, expire, and revoke access.

Same pattern for agents

Coding agents can experiment in a sandbox
AWS account without getting permanent access
or a path to production.
