

Alexey Grigorev

Agents need sandbox AWS access

The agent can experiment, but it should not reach production.

The rule

A coding agent should never have a path to production. If it can reach production AWS resources, the setup needs to change.

Disposable environment

Agents run on a remote sandbox server. If the server breaks, I can recreate it. Real infrastructure changes still go through CI/CD.

Temporary AWS access

When an agent needs AWS for an experiment, it gets temporary credentials for a separate sandbox account.

The useful boundary

The agent has enough room to explore and break things, but only in the sandbox and only for a limited time.
