Turn **AWS** access on from a phone

A temporary gate for agents working in a sandbox account.

The situation

Sometimes I want an agent to run an AWS experiment while I'm away from my laptop. I don't want admin credentials on my phone.

The toggle

The sandbox points its credential URI at a Lambda. A phone app toggles that Lambda on and off.

Short access windows

When the toggle is on, the Lambda returns temporary credentials. When it is off, the sandbox asks for credentials and fails.

Same mechanism

The same credential endpoint now supports workshops, coding agents in a sandbox account, and phone-controlled AWS access.
