

Alexey Grigorev

Working code can still be the wrong product

A vague prompt makes the agent decide product scope for you.

The prompt was too small

I asked for a weekly feedback tool. The agent built a CLI for weekly project health. It worked, but it was not the retrospective workflow I wanted.

The missing decisions mattered

The prompt did not define users, feedback format, anonymity, voting, reveal timing, clustering, or action items.

Agents fill gaps

When important product details are missing, the model has to invent them. Those assumptions often differ from what you had in mind.

Specify before coding

Write down users, workflow, MVP scope, out-of-scope items, and decisions the agent should avoid making.
