

Alexey Grigorev

Use AI to clarify before you code

A chat assistant can turn a vague idea into a project spec.

Start outside the coding agent

Use a chat assistant for product scoping. The goal is not implementation. The goal is to make decisions explicit.

Ask one question at a time

This keeps the session interactive and avoids a wall of text. You answer one decision, then move to the next.

Turn the idea into scope

Define users, workflow, anonymity, feedback timing, voting, action items, roles, screens, and MVP exclusions.

Then code

The coding agent becomes much more useful when it receives a direction instead of a vague wish.
