

Alexey Grigorev

Groom issues before agents implement them

Feature-level specs reduce guessing during
implementation.

Project specs are not enough

A project plan helps seed the backlog. Each feature still needs a crisp task before an implementation agent starts.

Use a PM role

The PM turns a rough issue into a goal, description, edge cases, acceptance criteria, and out-of-scope items.

Make criteria checkable

Someone should be able to point at the screen and say yes, this passes, or no, this fails.

Protect the MVP

Out-of-scope items matter. They stop the agent from adding reasonable extras that create maintenance work.

Watch the workshop

Spec-driven development with PM, engineer, and QA roles.
