

Alexey Grigorev

A local dashboard is a validation step

A team dashboard needs deployment, scheduled ingestion, and a durable destination.

Start locally

Read trace files, load them into DuckDB, open a Marimo report, and check whether the schema and charts make sense.

Validate with human context

Do the charts match your usage? Are important fields queryable? Did nested JSON become a usable schema?

Then make it shareable

Teams need scheduled pipeline runs, a cloud or private destination, and deployed reports that do not depend on a laptop.

Keep privacy in mind

Trace files can contain sensitive data. Use private storage or a warehouse destination when raw logs should not be shared directly.
