

Alexey Grigorev

Practical workflow: Module 4

A practical note for Open-Source AI Tools for
Security, Audit, and DevOps

The problem

AI-assisted projects still need security scanning, audit trails, incident investigation, and deployment discipline.

Control 1

Review generated code like any other production change.

Control 2

Make scanners available before the agent asks for deployment.

Control 3

Record what changed, which tools ran, and which checks passed.
